

Statement of participation

Oluwaseun Ajayi

has completed the free course including any mandatory tests for:

Blood and the respiratory system

This free course explored respiration and its importance for life, how breathing is controlled, and some diseases that affect respiration.

Issue date: 2 January 2024

www.open.edu/openlearn

This statement does not imply the award of credit points nor the conferment of a University Qualification.
This statement confirms that this free course and all mandatory tests were passed by the learner.

Please go to the course on OpenLearn for full details:

COURSE CODE: **SK299_1**

Blood and the respiratory system

<https://www.open.edu/openlearn/science-maths-technology/blood-and-the-respiratory-system/content-section-0>

Course summary

'Don't hold your breath' is an expression you've probably heard many times, but may not have thought too much about. In this free course, Blood and the respiratory system, you'll study why respiration is so important for life, including how air enters and leaves the lungs, how oxygen is transported in the blood, the many dynamic factors that control breathing, and some diseases that affect respiration.

Learning outcomes

By completing this course, the learner should be able to:

- describe and illustrate the main anatomical structures of the respiratory system and the mechanics of inspiration and expiration
- discuss the factors that affect pulmonary ventilation
- outline the mechanisms of O₂ and CO₂ transport in the blood
- describe diseases resulting from mutations in haemoglobin
- demonstrate an understanding of the control of the respiration rate.

Completed study

The learner has completed the following:

Section 1

Respiratory structures and ventilation

Section 2

Factors affecting pulmonary ventilation

Section 3

Lung function

Section 4

Gas exchange

Section 5

Inherited disorders of haemoglobin

Section 6

Control of respiration
