

Statement of participation

Oluwaseun Ajayi

has completed the free course including any mandatory tests for:

Drug development process: combating pain

This 2hour free course gave an introduction to the process of drug development, from identification of a candidate molecule to the new drugs daily use

Issue date: 16 October 2023

COURSE CODE: S827_1

Drug development process: combating pain

<https://www.open.edu/openlearn/science-maths-technology/drug-development-process-combating-pain/content-section-0>

Course summary

Drug development process: combating pain, is a free course offering a brief introduction to the process of new drug discovery; from identification of a suitable candidate drug molecule to the development of a commercial drug product available in the clinic for pain relief or as an anti-inflammatory.

Learning outcomes

By completing this course, the learner should be able to:

- appreciate the intrinsic difficulties associated with developing a drug molecule from conception into a medicine suitable for clinical use
- appreciate how molecular modelling can be used in the drug discovery process
- understand the historical background to pain control
- understand that opioids, steroids and NSAIDs all work at the molecular level
- appreciate that anti-inflammation drug discovery requires a detailed understanding of the biochemical processes that constitute the inflammatory response.

Completed study

The learner has completed the following:

Section 1

Drug discovery process

Section 2

Developing anti-inflammatory drugs

Section 3

Conclusion
