

Statement of participation

Oluwaseun Ajayi

has completed the free course including any mandatory tests for:

Influenza: A case study

This 6-hour free course explored the biology of influenza. Topics began with the virus itself, then all stages from infection through to treatment.

Issue date: 12 February 2024

COURSE CODE: **SK320_1**

Influenza: A case study

<https://www.open.edu/openlearn/science-maths-technology/biology/influenza-a-case-study/content-section-0>

Course summary

This free course, Influenza: A case study, explores the biology of influenza, covering a range of topics including: the virus, infection, replication, mutation, immune responses, pathology, surveillance, diagnosis and treatment.

Learning outcomes

By completing this course, the learner should be able to:

- define and use, or recognise definitions and applications of, each of the glossary terms in the course
- describe influenza viruses, their structure, how they are transmitted, how they infect cells and replicate and how they produce their damage in the host
- outline the different types of immune defence which are deployed against flu infections, distinguishing those that act against infected cells from those that act against free virus
- describe how strains of the virus change over time, and relate this to the flu viruses that occur in birds and other mammals
- explain how the epidemic pattern of influenza can be related to the evolution of new strains of virus and to the specificity of the immune response against each strain.

Completed study

The learner has completed the following:

Section 1

Background to the case study

Section 2

Influenza viruses

Section 3

Patterns of disease

Section 4

Antiviral treatments

Section 5

Diagnosis of influenza

Section 6

Conclusion

Section 7
